SUMMARY

Engineer with 4+ years of production experience in TypeScript, React/Next.js and Node.js, now focused on building LLM features and agents. With AI agents writing most of the code, I treat code itself as cheap and invest in guardrails instead — strict lint and type rules, tests, CI quality gates, agent rules and automated review — so a team can ship at agent speed and the codebase stays maintainable. At Yandex Go I build a high-load platform for automating customer communications and ship work end to end: UI, API layers, backend changes, CI/CD, releases and production support. I took LLM features in the platform from a hackathon idea to production: an “AI agent” step with tool calling and generation of scenarios from a text prompt. Outside work I build and run my own LLM products in production — an autonomous news agent, a Telegram assistant for AR glasses and an AI blog — owning quality, latency and LLM cost.

EXPERIENCE

AI Engineer — Yandex Go **Apr 2025 – present**

High-load low-code platform for automating customer communications. Stack: TypeScript, React, micro-frontends, Node.js, LLM APIs.

- Develop the frontend of a high-load low-code platform for automating customer communications; ship regular production releases and support them in production.
- Brought LLM features to production in the scenario editor: an “AI agent” step with tool calling and generation of a scenario from a text prompt — from a hackathon idea to a shipped feature.
- Work across the stack where needed: API layers, backend changes and CI/CD pipelines.
- Built role-based access control together with the backend: permission model, action gating and access sharing.
- Delivered scenario versioning and rollback, new messaging channels and template management.
- Integrated other teams' services and admin tools into the platform as micro-frontend modules.
- Set up guardrails for AI-assisted development in the team: agent rules, shared code-review skills for coding agents and quality checks, so agent-written code meets the team's standards before human review; ran internal AI-coding sessions.
- Set up frontend monitoring and alerting; review code and help teammates.

Frontend Developer — STOMPLAN **May 2024 – Apr 2025**

Dental treatment-planning SaaS. Stack: Angular, TypeScript.

- Took the product from zero to MVP launch: treatment-planning service and an interactive patient-presentation builder with PDF export.
- Led the migration to modern Angular; designed the navigation architecture and interactive content blocks.

Full-stack Developer — ShurikMarket (e-commerce) **Nov 2022 – May 2024**

Stack: React, Next.js, PHP/Symfony.

- Cut initial page load time, built an internal UI kit and shipped news, certificates, feedback and favourites services.
- Maintained the Symfony monolith, prepared its migration to a REST API and implemented user registration and authentication.

Frontend Developer — Yandex userver (open-source C++ framework) **May 2023 – Oct 2023**

- Built and maintained the documentation site UI for the open-source framework.

Frontend Developer — QCup (loyalty platform) **Nov 2021 – Dec 2022**

- Designed the application architecture from scratch (UI / business logic / data layers), REST integration, async state and error handling (React, TypeScript, Redux).

IT Systems Implementation Specialist — Gazprom **2016 – 2022**

- Implemented and supported enterprise systems (SAP, 1C, SharePoint, SQL); moved into software engineering in 2021.

PROJECTS (IN PRODUCTION)

- **Autonomous AI news agent** (Node.js, Claude / OpenAI / local models): collects sources, ranks and summarises them with LLMs via multi-provider routing to balance quality and cost; human approval in Telegram, then auto-publishes to the blog and a Telegram channel.
- **aifirst.us.com** — AI blog and LLM model comparison (Next.js, React, Node.js, PostgreSQL): feed, search and editorial CMS, ISR caching, JWT auth, guarded by zero-warning lint, locked design tokens, dead-code checks (knip), unit and e2e tests in CI/CD with GitHub Actions and self-hosted deployment (nginx, VPS).
- **rokid-ai** — Telegram assistant for AR glasses: an LLM turns a photo or voice note into a food-diary entry in a third-party API (OAuth, retry queue).
- **claude-control-bar** — open-source macOS menu-bar app for Claude Code sessions.

SKILLS

LLMs and agents: Anthropic and OpenAI APIs, tool calling, structured output, streaming, agent loops, MCP servers, prompt evals, multi-provider routing incl. local models, prompt and context engineering

Frontend: TypeScript, React 19, Next.js 15, micro-frontends (Module Federation), TanStack Query, Ant Design, MUI, Angular, Redux, accessibility and performance (ISR, RUM)

Backend: Node.js (Express, Next.js API routes), REST API design, PostgreSQL, SQLite, Redis, JWT/OAuth, RBAC, PHP/Symfony

Quality and delivery: Jest, Vitest, Playwright, CI/CD (GitHub Actions), Docker, nginx, release management, observability and alerting, on-call

AI-assisted development and guardrails: I use Claude Code and Cursor daily on production code. Custom skills and agent rules turn a task into a reviewed PR; lint rules, type checks, tests and CI gates keep agent-written code consistent and maintainable at high delivery speed.

Languages: English (B2), Russian (native)

EDUCATION

Yandex School of Interface Development — Frontend Developer, certificate, 2023

Tyumen State Oil and Gas University — Engineer’s degree, Chemical Technology, 2011
